# Approximation of inertial manifolds for semilinear evolution equations

Kazuo Kobayasi (Shonan Institute of Technology)

小林 和夫

## 1. Introduction.

Several of evolution equations, for example, the Kuramoto-Sivashinsky equation [7], [17], [20], the Cahn-Hilliard equation [17], [20] as well as reaction-diffusion equations [7], [9], [11], [14] have finite dimensional inertial manifolds. The restriction of those partial differential equations to the inertial manifold reduces to finite ordinary differential equations. An inertial manifold for an evolution equation is a smooth and positively invariant manifold under the flow which also attracts exponentially all orbits. Therefore, the long-time behavior of solutions of a partial differential equation possessing an inertial manifold is completely determined by the finite system of ordinary differential equations.

This note discusses the existence and the convergence of inertial manifolds for approximations to the semi-linear evolution equation in a Banach space  $Y$

$$du(t)/dt = Au(t) + F(u(t)), \quad t > 0$$

where  $A$  is the infinitesimal generator of a  $C_0$ -semigroup  $\{S(t); t \geq 0\}$  on  $Y$ , while  $F$  is a nonlinear operator. The approximations to the evolution equation considered here are associated with Chernoff's product formulas (see [2]).

## 2. Main results.

Let  $X$  and  $Y$  be Banach spaces with norms  $\|\cdot\|$  and  $|\cdot|$ ,

respectively, such that  $X$  is continuously embedded in  $Y$ . Let  $\{S(t); t \geq 0\}$  be a  $C_0$ -semigroup on  $Y$  and  $F \in \text{Lip}(X, Y) \cap C^1(X, Y)$ . Consider the following semilinear evolution equation

$$(2.1) \quad du(t)/dt = Au(t) + F(u(t)), \quad t \geq 0,$$

$$(2.2) \quad u(0) = x_0$$

where  $A$  is the infinitesimal generator of  $\{S(t)\}$ . It has been recently shown by several authors (e.g. see [3],[6],[7],[14],[16]) that (2.1) has an inertial manifold  $M$  under certain assumptions. More precisely, the following assumptions are considered:

(S1) There are constants  $\tilde{M} \geq 1$  and  $\tilde{\omega} \geq 0$  such that  $|S(t)y| \leq \tilde{M}e^{\tilde{\omega}t}|y|$  for  $t \geq 0$  and  $y \in Y$ .

(S2)  $S(t)Y \subset X$  for  $t > 0$  and  $S(t)x \in C([0, \infty); X)$  for  $x \in X$ .

(S3)  $Y = Y_1 + Y_2$  and  $P_i S(t) = S(t)P_i$  for  $i = 1, 2$  and  $t \geq 0$ , where  $Y_1$  is a closed linear subspace and  $P_i$  is a projection from  $Y$  onto  $Y_i$ .

(S4)  $\{S(t)P_i; t \geq 0\}$  forms a uniformly continuous semigroup on  $Y_1$ .

(S5) There exist constants  $\alpha, \beta > 0$ ,  $\gamma \in [0, 1)$ ,  $\eta < -\max\{\alpha, \beta\}$  and  $M_1, M_2, M_3, M_4 \geq 0$  such that

$$(2.3) \quad |e^{-\eta t} S(t)P_1 y| \leq M_1 e^{\alpha t} |y|, \quad t \leq 0, y \in Y,$$

$$(2.4) \quad \|e^{-\eta t} S(t)P_1 y\| \leq M_2 e^{\alpha t} |y|, \quad t \leq 0, y \in Y,$$

$$(2.5) \quad \|e^{-\eta t} S(t)P_2 x\| \leq M_3 e^{-\beta t} \|x\|, \quad t \geq 0, x \in X,$$

$$(2.6) \quad \|e^{-\eta t} S(t) P_2 y\| \leq (M_3 t^{-\gamma} + M_4) e^{-\beta t} |y|, \quad t > 0, y \in Y.$$

We note that the above assumptions ensure the unique mild solution  $u(t; x_0) \in C([0, \infty); X)$  of (2.1) and (2.2) for each  $x_0 \in X$  (e.g. see [18; Chapter 6]). Under the assumptions (S1)-(S5), Chow and Lu [3] proved that if

$$(2.7) \quad K(\alpha, \beta) \text{Lip} F < 1 \quad \text{and} \quad \frac{M_1 M_3 K(\alpha, \beta) \text{Lip} F}{1 - K(\alpha, \beta) \text{Lip} F} < 1$$

where

$$(2.8) \quad K(\alpha, \beta) = \hat{M} \{ M_2 \alpha^{-1} + M_3 \Gamma(1-\gamma) \beta^{\gamma-1} + M_4 \beta^{-1} \}$$

then there exists an inertial manifold  $M$  for (2.1) satisfying

- (a)  $M = \{ \xi + h(\xi); \xi \in Y_1 \}$  for some  $h \in C^1(Y_1, P_2 X)$ ,
- (b) if  $x_0 \in M$  then  $u(t; x_0) \in M$  for all  $t > 0$ ,
- (c) for each  $x_0 \in X$  there exists a unique element  $x_0^* \in M$  such that

$$\sup_{t \geq 0} e^{-\eta t} \|u(t; x_0) - u(t; x_0^*)\| < \infty.$$

Let  $\{C(\lambda)\}_{\lambda > 0}$  be a family of bounded linear operators in  $Y$ .

We now consider the following type of approximation to (2.1)

$$(2.9) \quad x_{n+1} = C(\lambda) x_n + \lambda J_{\nu(\lambda)} F(x_n), \quad n \geq 0,$$

where  $\lambda > 0$ ,  $\nu \in C(\mathbb{R}^+, \mathbb{R}^+)$  with  $\nu(0) = 0$ , and  $J_\nu = (I - \nu A)^{-1}$ , the resolvent of  $A$ . We shall make the following assumptions on the family  $\{C(\lambda)\}$ :

- (C1) There are constants  $\hat{M} \geq 1$  and  $\tilde{\omega} \geq 0$  such that  $|C(\lambda)^n y| \leq$

$\tilde{M}e^{\tilde{\omega}n\lambda}|y|$  for  $\lambda > 0$ ,  $n \geq 0$  and  $y \in Y$ .

(C2)  $\lim_{\lambda \downarrow 0} (I - h\lambda^{-1}(C(\lambda) - I))^{-1}y = J_h y$  in  $Y$  for each  $y \in Y$  and  $h > 0$  sufficiently small.

(C3)  $C(\lambda)C(\mu) = C(\mu)C(\lambda)$  and  $P_i C(\lambda) = C(\lambda)P_i$  for  $\lambda, \mu > 0$  and  $i = 1, 2$ , where  $P_i$  is a continuous projection from  $Y$  onto  $Y_i$  satisfying  $P_1 + P_2 = I$ .

(C4)  $[C(\lambda)P_1]^{-1} \in B(Y_1)$  for  $\lambda > 0$ .

(C5) There exist constants  $\alpha, \beta > 0$ ,  $\gamma \in [0, 1)$ ,  $\eta < -\max\{\alpha, \beta\}$  and  $M_1, M_2, M_3, M_4 \geq 0$  such that

$$(2.10) \quad |e^{\eta n\lambda} [C(\lambda)P_1]^{-n} P_1 y| \leq M_1 e^{-\alpha n\lambda} |y|,$$

$$(2.11) \quad \|e^{\eta n\lambda} [C(\lambda)P_1]^{-n} P_1 y\| \leq M_2 e^{-\alpha n\lambda} |y|,$$

$$(2.12) \quad \|e^{-\eta n\lambda} C(\lambda)^n P_2 x\| \leq M_3 e^{-\beta n\lambda} \|x\|,$$

$$(2.13) \quad \|e^{-\eta n\lambda} C(\lambda)^n J_{\nu(\lambda)} P_2 y\| \leq \{M_3((n+1)\lambda)^{-\gamma} + M_4\} e^{-\beta n\lambda} |y|$$

for  $n \geq 0$ ,  $x \in X$  and  $y \in Y$ .

Our first result is the following

Theorem 2.1. Assume that (C1)-(C5) are satisfied. If  $F \in \text{Lip}(X, Y) \cap C^1(X, Y)$  and (2.7) holds, then for all sufficiently small  $\lambda > 0$  there exists a manifold  $M_\lambda$  satisfying

(a) $_\lambda$   $M_\lambda = \{ \xi + h_\lambda(\xi); \xi \in Y_1 \}$  for some  $h_\lambda \in C^1(Y_1, P_2 X)$ ,

(b) $_\lambda$  if  $x_0 \in M_\lambda$ , then  $x_n \in M_\lambda$  for all  $n \geq 1$ ,

(c) $_\lambda$  for each  $x_0 \in X$  there exists a unique element  $x_0^* \in M_\lambda$  such that

$$\sup_{n \geq 0} e^{-\eta n \lambda} \|x_n - x_n^*\| < \infty,$$

where  $\{x_n^*\}$  is the sequence defined by (2.9) with initial  $x_0^*$  instead of  $x_0$ .

The second result concerns the stability of inertial manifolds for (2.1) with respect to the approximation (2.9).

Theorem 2.2. Assume that (S1)-(S5) and (C1)-(C5) are satisfied. If  $F \in \text{Lip}(X, Y) \cap C^1(X, Y)$  and (2.7) holds, then

$$\lim_{\lambda \downarrow 0} \|h_\lambda(\xi) - h(\xi)\| = 0 \quad \text{for } \xi \in Y_1,$$

and the convergence is uniform with respect to  $\xi$  belonging to each compact subset of  $Y_1$ . Here  $h_\lambda$  and  $h$  are the functions appearing in  $(a)_\lambda$  and  $(a)$ , respectively.

As an application of the above theorems we shall consider the family

$$(2.14) \quad C(\lambda) = (I + (1-\theta)\lambda A)(I - \theta\lambda A)^{-1}$$

In this case (2.9) with  $v(\lambda) = \theta\lambda$  is written as

$$(2.15) \quad \lambda^{-1}(x_{n+1} - x_n) = A(\theta x_{n+1} + (1-\theta)x_n) + F(x_n)$$

Theorem 2.3. Let  $\theta = 1$ . Suppose that  $\{S(t)\}$  satisfies (S1)-(S5) with  $\alpha \leq -\eta - \|AP_1\|_{L(Y_1)}$ . Then the family  $\{C(\lambda)\}$  defined by (2.14) satisfies (C1)-(C5).

Theorem 2.4. Let  $1/2 < \theta < 1$ . Suppose that  $\{S(t)\}$  satisfies (S1)-(S5) with  $\tilde{M} = M_3 = 1$  and  $\alpha \leq -\eta - \|AP_1\|_{L(Y_1)}$ . If  $X$  and  $Y$  are

Hilbert spaces, then the family  $\{C(\lambda)\}$  defined by (2.14) satisfies (C1)-(C5).

Remark. Condition (S4) implies that  $AP_1$  can be regarded as a bounded linear operator in  $Y_1$ . By combining the above theorems we can conclude that the approximation (2.15) possesses an inertial manifold which converges to the original one for (2.1). When  $\theta = 1$ , this result has proved by Demengel and Ghidaglia [5] by a different method. When  $\theta = 1/2$ , (2.15) is called the scheme of Crank-Nicholson in Hilbert spaces. We do not however know if (2.14) with  $\theta = 1/2$  satisfies (C1)-(C5).

Conversely, we consider the problem about the existence of inertial manifolds for (2.1) when the approximation (2.9) possesses an inertial manifold.

Theorem 2.5. Assume (C1), (C3), (C4), (C5) and the following conditions:

(X)  $X$  is densely and continuously embedded in  $Y$  and  $X$  is reflexive.

(C2)\* There exists a dense subset  $D$  of  $Y$  such that

$$\lim_{\lambda \downarrow 0} \lambda^{-1}(C(\lambda)y - y) = Ay \text{ exists in } Y \text{ for } y \in D,$$

$(I - \lambda_0 A)D$  is dense in  $Y$  for some  $\lambda_0 > 0$ , and  $Y_1 \subset D$ .

Then the closure  $\bar{A}$  of  $A$  generates a  $C_0$ -semigroup  $\{S(t); t \geq 0\}$  on  $Y$  satisfying (S1)-(S5).

The proofs of the above theorems will be given in [12].

### 3. Examples.

In this section  $H$  denotes a Hilbert space with norm  $|\cdot|$ . Let  $A$  be a nonnegative self-adjoint operator in  $H$ .  $\{S(t)\}$  denotes a  $C_0$ -semigroup on  $H$  generated by  $-A$ . Suppose that  $(A + \lambda I)^{-1}$  is a compact operator for some  $\lambda \geq 0$ . Then, the eigenvalues  $\tilde{\lambda}_j$  of  $A + \lambda I$  satisfy

$$0 < \tilde{\lambda}_1 \leq \tilde{\lambda}_2 \leq \dots \leq \tilde{\lambda}_j \leq \dots \rightarrow \infty \quad \text{as } j \rightarrow \infty$$

and the corresponding eigenvectors  $e_j$  form an orthonormal basis of  $H$ . We note that the eigenvalues  $\lambda_j$  of  $A$  is equal to  $\tilde{\lambda}_j - \lambda$ .

Let  $N > 0$  be an integer and  $P_1$  be the projection from  $H$  into  $\text{span}\{e_1, \dots, e_N\}$  and  $P_2 = I - P_1$ . Let  $\Lambda = A + \lambda I$ . Then, for each  $\gamma \in [0, 1)$  we have the following properties:

$$|\Lambda^\gamma S(t) P_1 x| \leq \tilde{\lambda}_N^\gamma e^{-\lambda_N t} |x|, \quad t \leq 0, x \in H,$$

$$|P_2 S(t) x| \leq e^{-\lambda_{N+1} t} |x|, \quad t \geq 0, x \in H,$$

$$|\Lambda^\gamma S(t) P_2 x| \leq (t^{-\gamma} + \tilde{\lambda}_{N+1}^\gamma) e^{-\lambda_{N+1} t} |x|, \quad t > 0, x \in H.$$

Let  $Y = H$  and  $X = D(\Lambda^\gamma)$  be the Hilbert space with the graph norm. If we set  $\eta = -(\lambda_{N+1} + \lambda_N)/2$ ,  $\alpha = \beta = (\lambda_{N+1} - \lambda_N)/2$ ,  $\tilde{M} = M_1 = M_3 = 1$ ,  $M_2 = \tilde{\lambda}_N^\gamma$  and  $M_4 = \tilde{\lambda}_{N+1}^\gamma$ , then the hypotheses (S1)-(S5) in Section 2 are satisfied. Moreover, we have that  $\|AP_1\|_{L(Y_1)} \leq \lambda_N$ .

Consider an evolution equation

$$(3.1) \quad du/dt + Au = R(u), \quad t > 0, \quad u(0) = x_0$$

in the Hilbert space  $Y$ , where  $R \in C^1(X, Y)$ . Suppose that the following conditions (i) and (ii) are satisfied.

(i) There exists a closed subset  $D$  of  $X$  such that for each  $x_0 \in D$  (3.1) has a unique mild solution  $u(\cdot; x_0) \in C([0, \infty); D)$ .

(ii) For each  $x_0 \in D$  there exists  $T_0 = T_0(x_0) > 0$  such that  $\|u(t; x_0)\|_X \leq \rho$  for all  $t \geq T_0$ , where  $\rho$  is a positive constant independent of  $x_0$ .

Then, the following modification

$$(3.2) \quad du/dt + Au = F(u), \quad t > 0, \quad u(0) = x_0$$

with

$$F(u) = \theta_\varepsilon(\|u\|_X)R(u), \quad 0 < \varepsilon < 1/2\rho$$

$$\theta_\varepsilon(s) = \theta(s/\varepsilon), \quad \theta \in C_0^\infty(\mathbb{R}), \quad 0 \leq \theta \leq 1,$$

$$\theta(s) = 1 \quad \text{for } |s| \leq 1, \quad \theta(s) = 0 \quad \text{for } |s| \geq 2,$$

provides the same asymptotic behavior as  $t \rightarrow \infty$  on  $D$ . Since the norm of  $X$  is smooth,  $F \in C^1(X, Y) \cap \text{Lip}(X, Y)$ . Therefore, we can apply our theorems in Section 2 to (3.2). In this case the condition (2.7) holds true whenever

$$(3.3) \quad \lambda_{N+1}^\gamma (\lambda_{N+1} - \lambda_N)^{-1} \rightarrow 0 \quad \text{as } N \rightarrow \infty.$$

Thus we have

**Theorem 3.1.** Let  $A$  and  $R$  be defined as above. Assume that (i) and (ii) are satisfied. If (3.3) holds, then (3.1) has an inertial manifold  $M_D$  in  $D$ , i.e.,

$$(A)_D \quad M_D = \{\xi + h(\xi); \xi \in P_1 D\} \quad \text{for some } h \in C^1(P_1 Y, P_2 X).$$

$$(b)_D \quad \text{If } x_0 \in M_D \text{ then } u(\cdot; x_0) \in M_D \text{ for all } t > 0.$$

$$(c)_D \quad \text{For each } x_0 \in D \text{ there exists } x_0^* \in M_D \text{ such that}$$

$$\sup_{t \geq 0} e^{-\eta t} \|u(t; x_0) - u(t; x_0^*)\|_X < \infty.$$

Moreover, Theorems 2.2-2.5 apply to (3.1) in D.

Example. (The Cahn-Hilliard equation)

Let  $\Omega$  be a bounded domain in  $\mathbb{R}^d$ ,  $d \leq 2$ . We consider the following equation

$$(3.4) \quad u_t - \Delta(-\Delta u - \alpha u + \beta u^3) = 0 \quad \text{in } \Omega \times \mathbb{R}^+$$

$$(3.5) \quad u(\cdot, 0) = u_0(\cdot) \quad \text{in } \Omega$$

and

$$(3.6)_n \quad \partial u / \partial n = \partial \Delta u / \partial n \quad \text{on } \partial \Omega \times \mathbb{R}^+, \text{ if } \partial \Omega \text{ is smooth}$$

or

$$(3.6)_p \quad u(x + 2\pi e_i, t) = u(x, t) \quad \text{on } \Omega \times \mathbb{R}^+, \text{ if } \Omega = [-\pi, \pi]^d$$

where  $\alpha$  and  $\beta$  are positive constants,  $n$  is the unit vector normal to  $\partial \Omega$  and  $e_i$  is the canonical basis of  $\mathbb{R}^d$ .

Set  $A = \Delta^2$  with  $D(A) = \{u \in H^4(\Omega); u \text{ satisfies } (3.6)_n \text{ or } (3.6)_p\}$ . Then, the operator  $\Lambda = A + I$  in  $L^2(\Omega)$  satisfies the properties stated above. Let  $Y = L^2(\Omega)$ ,  $X = D(\Lambda^{1/2})$  and  $R(u) = \Delta(-\alpha u + \beta u^3)$ . It is easy to see that  $R \in C^1(X, Y)$ . For each  $\rho > 0$  we set

$$D = \{u \in X; \left| \int_{\Omega} u \, dx \right| \leq \rho |\Omega| \}.$$

It is proved in [17, Proposition 1.1] that the set  $D$  satisfies

(i) and (ii). The eigenvalues  $\lambda_N$  of  $A$  satisfies  $\lambda_N \sim N^4$  as  $N \rightarrow \infty$  if  $d = 1$ , which implies that (3.3) holds with  $\gamma = 1/2$ . Hence, Theorem 3.1 applies to (3.4) with  $(3.6)_n$  or  $(3.6)_p$  if  $d = 1$ . If  $d = 2$ , then  $\lambda_N \sim N^2$  as  $N \rightarrow \infty$ , which does not imply (3.3) in

general. We know, however, that the eigenvalues  $\mu_j$  of  $-\Delta$  with the periodic boundary condition  $(3.6)_p$  have the form

$$\mu_j = k_1^2 + k_2^2$$

where  $k_1$  and  $k_2$  are integers. It follows from [19] that there is a subsequence  $\{N_k\}$  such that  $\mu_{N_k+1} - \mu_{N_k} \rightarrow \infty$  as  $K \rightarrow \infty$ .

Since  $\lambda_j \sim \mu_j^2$  as  $j \rightarrow \infty$ , (3.3) (with  $\gamma = 1/2$ ) holds true for  $N = N_k$ . Consequently, Theorem 3.1 applies again to (3.4) with  $(3.6)_p$  when  $d = 2$ .

We can also treat the Kuramoto-Sivashinsky equation, a modified Navier-Stokes equation and a reaction-diffusion equation (see [12]).
